

Accessibility Testing Report

Quality Assurance accessibility review for website usability, readability, keyboard navigation, and visual accessibility.

Project Title	Accessibility Testing Report
Prepared By	Ruknuddin Asrari
Role	Software Quality Engineer
Department	IT Software Development
Organization	The Career Insights Hub LLC
Test Type	Manual accessibility QA review
Test Scope	Website readability, alt text, controls, keyboard navigation, and color contrast
Total Observations	12
Overall Result	Needs improvement before accessibility sign-off

Objective

Perform basic accessibility testing for a website and prepare a quality report that includes observations, impact, recommended fixes, and supporting screenshots.

Test Coverage

Text readability; image alt text; button and link visibility; keyboard navigation; color contrast; form/search accessibility; heading structure; error handling.

Accessibility Observations

ID	Area	Sev.	Observation	Impact	Recommended Fix	Status
A11Y-001	Text Readability	Medium	Body text uses small font size on some content sections	Users with low vision may struggle to read page content	Increase body text to at least 16px, use readable line-height, and avoid long text blocks	Fail
A11Y-002	Text Readability	Low	Some paragraphs have dense spacing and limited white space	Content becomes difficult to scan	Increase spacing between paragraphs and group related content under clear headings	Fail
A11Y-003	Image Alt Text	High	Decorative and content images do not consistently provide meaningful alt text	Screen-reader users may miss image purpose/context	Add descriptive alt text for meaningful images and empty alt for decorative images	Fail

ID	Area	Sev.	Observation	Impact	Recommended Fix	Status
A11Y-004	Button Visibility	Medium	Primary button color is visible but hover/focus feedback is not clearly noticeable	Keyboard and low-vision users may not know which control is active	Add stronger hover and focus styles using outline and contrast	Fail
A11Y-005	Link Visibility	Medium	Some links rely only on color to indicate clickability	Color-blind users may not identify links easily	Underline text links or add another non-color visual indicator	Fail
A11Y-006	Keyboard Navigation	High	Visible focus indicator is missing or weak on some buttons/links	Keyboard-only users may lose track of navigation position	Add consistent :focus-visible outline to all interactive elements	Fail
A11Y-007	Keyboard Navigation	High	No visible skip-to-content link observed	Keyboard users must tab through repeated navigation on every page	Add a skip link that becomes visible on focus	Fail
A11Y-008	Color Contrast	High	Light gray text on white background may not meet WCAG contrast expectations	Users with low vision may have difficulty reading text	Use darker text color and validate contrast against WCAG AA	Fail
A11Y-009	Color Contrast	Medium	Button text contrast should be verified across default, hover, and disabled states	Controls may become hard to read in certain states	Use WCAG AA contrast checks for all button states	Needs Review
A11Y-010	Forms/Search	Medium	Search input placeholder is helpful but label association should be confirmed	Screen readers may not announce field purpose correctly	Add visible label or aria-label connected to the search input	Needs Review
A11Y-011	Headings	Medium	Heading levels should follow a logical sequence	Screen-reader users may find page structure confusing	Use one H1 per page and sequential H2/H3 structure	Needs Review
A11Y-012	Error Handling	High	Validation/error messages should be announced clearly	Assistive technology users may miss errors	Use aria-live or role=alert for validation messages	Needs Review

Improvement Suggestions

Recommended Improvements

1. Increase text readability by using readable font sizes, proper spacing, and clear section headings.
2. Add descriptive alt text for all meaningful images.
3. Use empty alt text for decorative images so screen readers can skip them.
4. Add strong visible focus indicators for all buttons, links, inputs, menus, and controls.
5. Add a skip-to-content link for keyboard users.
6. Improve color contrast for light gray text and disabled/secondary UI states.
7. Do not rely only on color to identify links or important UI states.
8. Ensure search inputs and form fields have visible labels or accessible aria-labels.
9. Use aria-live or role=alert for validation and error messages.
10. Maintain a logical heading structure using one H1 and sequential H2/H3 headings.
11. Verify all controls can be reached and operated using only the keyboard.
12. Retest accessibility after fixes using manual review and browser accessibility tools.

Retest Recommendation

After fixes are implemented, perform a regression accessibility test covering keyboard navigation, screen-reader label checks, color contrast validation, and form error handling.

Sample Screenshots

01 Text Readability And Contrast

02 Keyboard Navigation Review

Keyboard Navigation Review

This sample screen is used as QA evidence for accessibility review.

Get Started

Focus indicator should be stronger

Image Area

Search results and content sections must remain readable, keyboard accessible, and clear for users using assistive technologies or low-vision settings.

Missing skip-to-content link

Link should not rely on color only

Prepared by Ruknuddin Asrari

03 Form And Error Handling Review

Form Accessibility Review

This sample screen is used as QA evidence for accessibility review.

Get Started

Errors should be announced with aria-live

Image Area

Search results and content sections must remain readable, keyboard accessible, and clear for users using assistive technologies or low-vision settings.

Search input needs accessible label

Clear message text required

Prepared by Ruknuddin Asrari

Conclusion

The website requires accessibility improvements before final QA sign-off. The highest priority fixes are keyboard focus visibility, alt text, skip link support, color contrast, and accessible form labels.
